

INFORMATION REGARDING FR PAINT ADDITIVES

DON'T GET FOOLED BY A FALSE SENSE OF SECURITY!

Please be aware that if you read the fine print for all paint additives. The instructions will indicate exactly the brand of paint that the end-user must mix it with; (usually, this is another one of their products).

There is no paint additive on the market that has testing on every type of, "Latex Paint" or "Acrylic Paint" due to various formulations. If that were true, the flame-retardant manufacturer would have to have testing on every formulation in the marketplace.

Instead of using two products and mixing, which involves employee time and extra hassle, why not just use Firetect's WT-102 ONE COAT FLAME RETARDANT, CLASS A PAINT?

Remember, you are using a flame-retardant product for a reason; make sure that it is applied in accordance to the manufactures directions so that the product performs properly.
